## Services Overview

AppStudio specializes in Client-Server, Thin-Client Web Applications and Microsoft Windows CE applications developed using Sybase PowerBuilder and Microsoft Visual C++.

AppStudio also provides full service turn-key solutions which includes network installation, application development, training and support.

### Client-Server Applications

AppStudio can develop two-tiered or three tiered client-server Windows applications. All applications can be run natively under Windows 98, Windows NT or Windows 2000.

AppStudio client-server applications are database independent so you can start with a Microsoft Access database today and grow into a Microsoft SQL Server or an Oracle database in the future with no code changes. AppStudio applications take full advantage of your database's client-server abilities such as the implementation of stored procedures, rules and triggers. Database integrity is performed on the server to ensure rule enforcement by all client applications.

Our Client-Server Applications have the look and feel similar to standard Microsoft Windows applications and integrate with Microsoft Office so little training is needed.

AppStudio supplies all source code to the customer for custom-developed applications.

### Thin-Client Web Applications

AppStudio can develop thin-client web applications that can be executed from within a web browser such as Microsoft Internet Explorer from a computer anywhere in the world with access to the Internet. These thin-client applications can give you access to your corporate data from anywhere in the world. Web applications can be separate or integrated with your existing client-server applications.

Web applications are created by collecting all application business logic and creating server components. These server components can access information from your corporate databases. The components are called by the client browser, but executed on the server. This allows for very thin-client, fast applications.

These web applications can be very sophisticated and can be used to add, edit and update data from multiple tables in the database at the same time. Applications can be scaled to handle from 1 to 1,000,000 transactions per minute.

### Microsoft Windows CE Applications

AppStudio can develop Windows CE applications for H/PC (Handheld PC) devices and the new Pocket PC devices.

Windows CE devices can run powerful programs and integrate with email, databases and the Internet. These applications can synchronize data with your desktop data or client-server data. Windows CE devices can be outfitted with wireless modems to give you access to your data from anywhere, anytime.

### Installation and Maintenance

AppStudio can install, administer and maintain the following systems:

#### *Operating Systems*

Windows 98

Windows ME

Windows NT Workstation and Server

Windows 2000 Professional and Server

Windows XP Professional

#### *Enterprise Services*

Microsoft Exchange

Microsoft Internet Information Server

Microsoft Proxy Server

Microsoft Terminal Server

#### *Database Servers*

Microsoft SQL Server

Oracle

Sybase
