

Services Overview

AppStudio is a developer of customized Internet and Windows applications and Apple iOS Apps for iPhone and iPad. We specialize in Microsoft .NET and Objective C++ development. AppStudio has been developing software for businesses, local, county and federal governments since 1989.

AppStudio also provides full service turn-key solutions with includes network installation, application development, training and support.

Client-Server Applications

AppStudio can develop two-tiered or three tiered client-server Windows applications.

AppStudio client-server applications are database independent so you can start with a Microsoft Access database today and grow into a Microsoft SQL Server or an Oracle database in the future with no code changes. AppStudio applications take full advantage of your database's client-server abilities such as the implementation of stored procedures, rules and triggers. Database integrity is performed on the server to ensure rule enforcement by all client applications.

Our Client-Server Applications have the look and feel similar to standard Microsoft Windows applications and integrate with Microsoft Office so little training is needed.

AppStudio supplies all source code to the customer for custom-developed applications.

Thin-Client Web Applications

AppStudio can develop thin-client web applications that can be executed from within a web browser such as Microsoft Internet Explorer from a computer anywhere in the world with access to the Internet. These thin-client applications can give you access to your corporate data from anywhere in the world. Web applications can be separate or integrated with your existing client-server applications.

Web applications are created by collecting all application business logic and creating server components. These server components can access information from your corporate databases. The components are called by the client browser, but executed on the server. This allows for very thin-client, fast applications.

These web applications can be very sophisticated and can be used to add, edit and update data from multiple tables in the database at the same time. Applications can be scaled to handle from 1 to 1,000,000 transactions per minute.

Table PC Applications

AppStudio can develop Apple iOS applications for the iPad or iPhone. We also develop Metro applications for Windows 8.

Tablet devices can run powerful programs and integrate with email, databases and the Internet. These applications can synchronize data with your desktop data or client-server data.

Installation and Maintenance

AppStudio can install, administer and maintain the following systems:

Operating Systems

Microsoft Windows XP
Microsoft Windows 7
Microsoft Server 2003
Microsoft Server 2008

Enterprise Services

Microsoft Exchange
Microsoft Internet Information Server
Microsoft Proxy Server
Microsoft Terminal Server

Database Servers

Microsoft SQL Server
Oracle
Sybase

14179 Stowbridge Avenue
Tampa, FL 33626
